

Dating App Analysis

Rithika, Sonali, Amir, Yonglin

What Are We Analyzing & Why

Dating Behavior

We examine how users interact on a dating app through conversations, matches, and ghosting patterns.

User Characteristics

age, gender, education, etc. relate to engagement and behavior

App Engagement

How users interact through conversation length, match count, and messaging activity.

Why It Matters

Dating apps shape modern relationships. Understanding behavior helps improve user experience and reduce negative patterns like ghosting

How We Analyzed the Data

- Cleaned and standardized column names for consistency
 - Removed outliers using Z-scores
- Engineered new features (ghosting rate, conversation success rate, age filter range)
 - Ran exploratory data analysis using bar charts, histograms, and boxplots
- One-hot encoded categorical variables for machine learning
- Trained a Random Forest model using safe, non-leaky features

Questions Asked

Boxplot

Do different age groups communicate differently?

Bar Chart

Does education level affect how many ghosting occur after the first message?

Pie Chart

What is the gender breakdown of users?

Bar Chart

Do men and women receive different numbers of matches?

Histogram

What is the age distribution of users?

Results/Visualizations

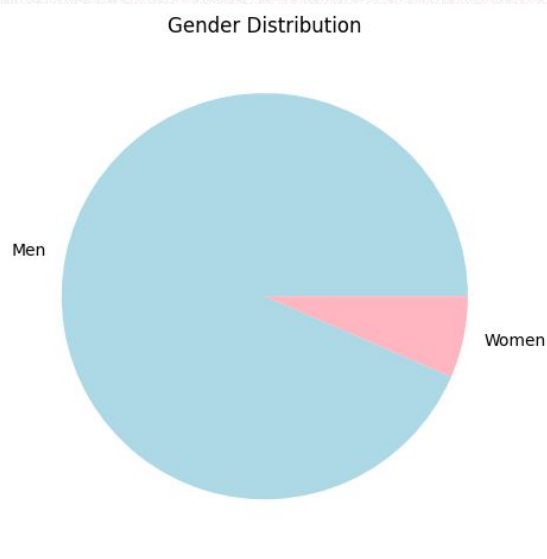

Women receive 2x more matches than men

Average Number of Matches by Gender

More men on the dating app

Gender Distribution

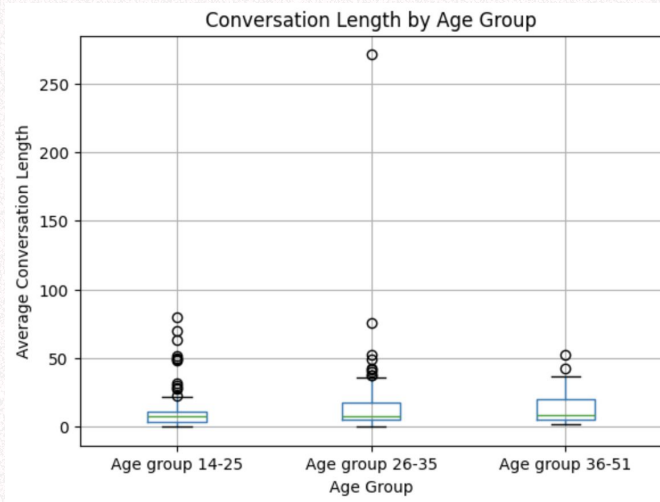

Age range is around 19-22 year olds

Age Distribution of Users

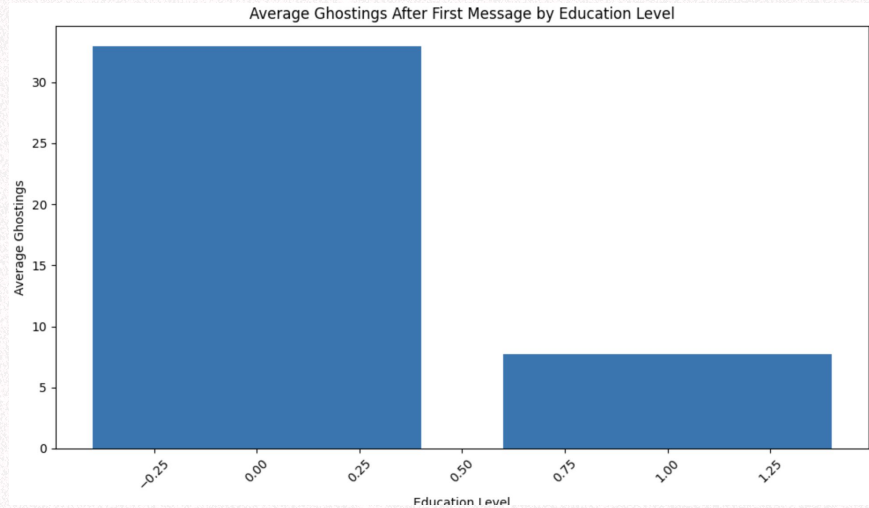

Results/Visualizations

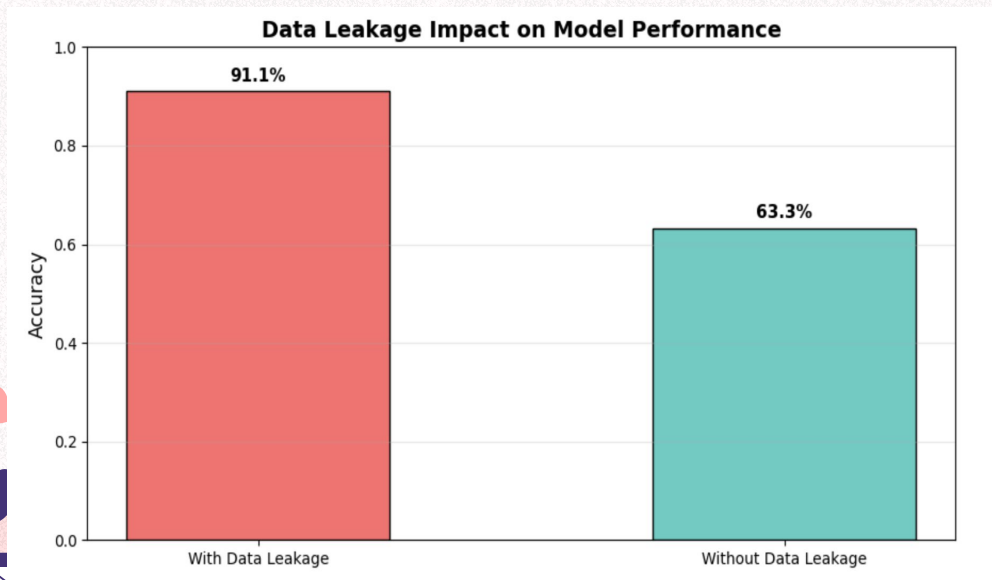

Age doesn't strongly influence engagement patterns

Educating is a significant factor in dating app success

Machine learning analysis

Real Model Accuracy: 67.6%

Top Features:

1. Age: 0.385
2. Maximum of Age filter: 0.225
3. Age_Filter_Range: 0.239
4. Minimum of Age filter: 0.151

Leakage Model variable relation:

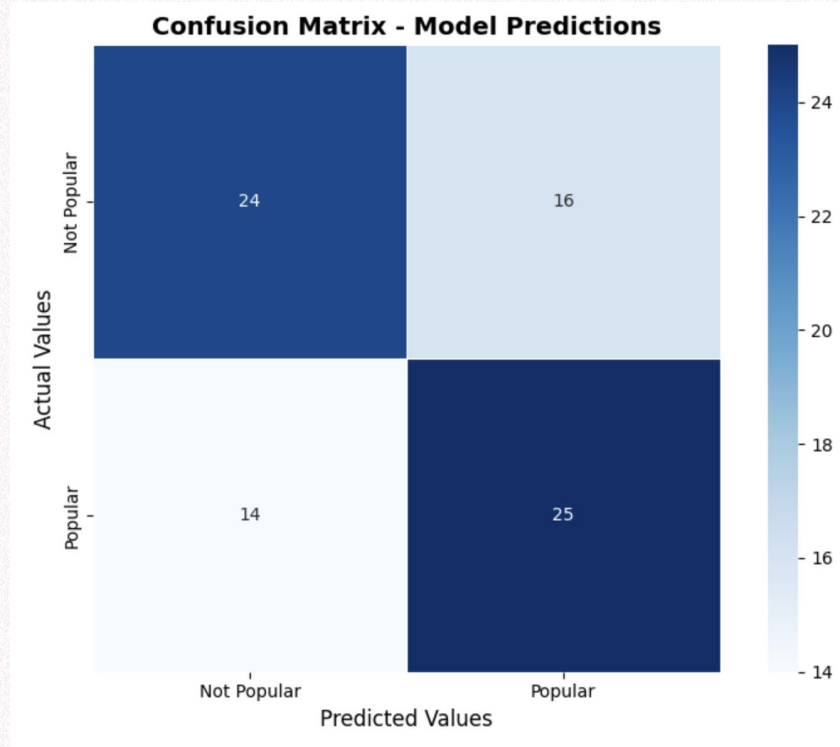

Number of Conversations: 0.848
(strong positive)

Number of Ghostings after 1st
Message: 0.638 (strong positive)

Maximum of Age filter: 0.211
(moderate positive)

Confusion matrix heatmap

“We used a Random Forest classifier to predict whether a user would be a high-match user based on age and age-filter settings.”

Conclusion & Impact

Men should expect fewer matches - it's normal, not a reflection of them personally
Education level correlates with ghosting behavior - certain education levels ghost way more

Wider age filters = more matches - casting a wider net increases your chances

Thank You!
